General Information

- EPDs within the same product category but registered in different EPD programmes, or not compliant with EN 15804, may not be comparable. For two EPDs to be comparable, they must be based on the same PCR (including the same version number) or be based on fully-aligned PCRs or versions of PCRs; cover products with identical functions, technical performances and use (e.g. identical declared/functional units); have equivalent system boundaries and descriptions of data; apply equivalent data quality requirements, methods of data collection, and allocation methods; apply identical cut-off rules and impact assessment methods (including the same version of characterisation factors); have equivalent content declarations; and be valid at the time of comparison. For further information about comparability, see EN 15804 and ISO 14025.
- BlueScope Steel Limited has sole ownership, liability and responsibility for this EPD.

BlueScope Sustainability Snapshot

Sustainability and Climate Action

Our vision for BlueScope in Australia is to be a vibrant, modern manufacturer, embodying progress, innovation and sustainability.

Steel is central to a circular economy – one where resources and materials are kept in use for as long as possible and then repaired, returned or recycled. Steel can be infinitely recycled and is 100% recyclable without loss of quality, in some cases it can be reused without reprocessing.

We recognise that steelmaking is emissions-intensive and we are committed to climate action. We strive to reduce the embodied carbon of our products, which is supported by our climate strategy and plans.

Building a pathway to low emission-intensity iron and steelmaking in Australia is a key priority for our business. Our global decarbonisation pathway outlines the steps we plan to take to meet our 2030 greenhouse gas emission targets¹ and net zero 2050 goal².

For more information on BlueScope's approach to sustainability and climate action visit steel.com.au/sustainability

Credentials and certifications

A number of BlueScope's products, product disclosures, and operations are recognised by third-party programs and credentials. These credentials are recognised in rating tools in Australia including Green Star, IS Rating and the Living Building Challenge.

BlueScope's Port Kembla Steelworks site, where the steel for BlueScope's branded products is manufactured, is certified to the ResponsibleSteel™ Standard v1.1. The ResponsibleSteel™ certification can give organisations in the steel value chain confidence in the environmental, social and governance performance of our steelmaking facilities, and may help them to meet their climate objectives and manage supply chain risks.

In addition to Environmental Product Declarations, a range of BlueScope products are certified to the ecolabel Global GreenTag^{cert™} GreenRate[™] and have achieved the highest rating, 'Level A'.

For more information about BlueScope's credentials and certifications, including how they can contribute to a project's Green Star rating, visit steel.com.au/sustainability

- Applies to our Scope 1 and 2 emissions, relative to a 2018 baseline, across our midstream or non-steelmaking activities. The non-steelmaking target applies to our midstream activities that include our cold rolled, metal coating and painting lines and long and hollow products. It excludes our downstream activities.
- Cour not zero goal covers BlueScope's scope 1 and 2 greenhouse gas emissions across our operations. We acknowledge that achieving this goal is highly dependent on several enablers, including the development and diffusion of ironmaking technologies to viable and commercial scale; access to appropriate quality and sufficient quantities of economic raw materials; access to internationally cost-competitive, firmed large-scale renewable energy; availability of competitively priced green hydrogen, with natural gas enabling the transition to green hydrogen; and supportive and consistent policy policies across all of these enablers to underpin decarbonisation.

COLORBOND® steel for fencing - Fence panels: Substrate AM100 coating at 0.35mm BMT

Declared Unit

This EPD provides data for one flat square metre (1 m²) of COLORBOND® steel for fencing – fence panels, with a substrate metal coating class of AM100 in 0.35mm base metal thickness (BMT) manufactured by BlueScope in Australia.

Product Description

COLORBOND® steel for fencing is a strong, durable and easy to maintain product with good formability and outdoor performance specifically designed for fencing applications.

This EPD sets out information on the COLORBOND® steel for fencing – fence panels product³ manufactured by BlueScope in Australia, with a hot dipped aluminium, zinc, and magnesium alloy (AM100) coated substrate, in the 0.35mm base metal thicknesses (BMT). The COLORBOND® steel for fencing - fence panel product represented in this EPD consists of a steel substrate that is coated with a metallic coating incorporating BlueScope's Activate® technology (hot dipped aluminium, zinc, and magnesium alloy (AM100) coating) to provide corrosion resistance, and then further protected and enhanced with a specially developed, exterior-grade, oven-baked paint system.

The metallic coated base steel (G550S strength grade) conforms to AS 1397:2021: Continuous hot-dip metallic coated steel sheet and strip - Coatings of zinc and zinc alloyed with aluminium and magnesium.

The paint system meets the performance requirements of AS/NZS 2728:2013: Prefinished/pre painted sheet metal products for interior/exterior building applications - Performance requirements.

| Product | Metallic Coating | Base Metal Thickness (BMT) | Product mass (kg/m² flat product) | |
|---|---------------------|----------------------------------|---|--|
| COLORBOND® steel for fencing – fence panels | AM100 | 0.35mm | 2.93 | |

Manufacturing Process

In Australia, BlueScope manufactures steel from raw and recycled materials using an 'integrated steelmaking' method. This involves the use of iron ore, coal, steel scrap, fluxes (limestone and dolomite) and alloying materials to produce steel slab via the major processes of sintering, coke making, Blast Furnace/Basic Oxygen Furnace (BF-BOF) steelmaking and continuous slab casting, prior to hot rolling into hot rolled coil steel.

The hot rolled coil is then cold reduced. Cold reduction involves pickling (acid cleaning) the coil, followed by cold rolling, where the steel coil is compressed and elongated through rolls to reduce its thickness and increase the strength of the steel. Following cold reduction, the coil is annealed to the required strength, metallic coated for corrosion resistance and skin passed for improved surface finish at the continuous hot-dipped metal coating lines. The metallic coated coil is then transferred to a paint line, where pre-treatment, primer, finish and reverse coat layers are baked on to produce the COLORBOND® steel for fencing - fence panels product prior to recoiling and packaging ready for shipment to customers for processing. Fencing panels are double-sided, with the same colour applied on both sides.

Downstream processing

COLORBOND® steel for fencing - fence panels product is supplied by BlueScope to downstream processors in coils. These coils are uncoiled and formed into fence panels. A wide variety of attractive profiles with different spanning strengths, fixing methods and visual aesthetics are produced. The finished products are transported to site for installation along with the posts and rails.

To provide indicative results for the final formed product up to the rollforming gate, data has been obtained from selected sites of several rollformers based in Australia, including Lysaght (all sites), Metroll (Perth, Albany and Bunbury sites) and Steeline (Hunter site). These results are presented as 'A1-A3 incl. rollforming' in the Results section. The indicative rollforming results represent an average of the data collected across the range of steel products formed from the surveyed sites⁴. These results may not be representative of the final formed product from any particular rollforming operation, company or site. Actual results will vary depending on a range of factors specific to the particular operations of the downstream processors.

Product Content

The average composition⁵ of one flat square metre (1 m²) of COLORBOND® steel for fencing - fence panels, with a substrate metal coating class of AM100 in 0.35mm base metal thickness (BMT) is:

| Product Composition | | Mass (kg) | Post-consumer recycled material, weight-% of product | Biogenic material, weight-% of product | Biogenic material, kg C/declared unit | |
|---------------------|---------------------------|-------------|--|--|--|--|
| Steel Substrate | Carbon Steel | 2.75 | O% ⁶ | 0% | 0 | |
| | Aluminium | 0.049-0.059 | 0% | 0% | 0 | |
| Metallic Coating | Magnesium | 0.001-0.003 | 0% | 0% | 0 | |
| (AM100) | Silicon | 0.001-0.002 | 0% | 0% | 0 | |
| | Zinc | 0.040-0.053 | 0% | 0% | 0 | |
| Data Carata a | Topcoat ⁷ | 0.04 | 0% | 0% | 0 | |
| Paint Coatings | Backing coat ⁸ | 0.04 | 0% | 0% | 0 | |
| SUM | , | 2.93 | O% ⁶ | 0% | 0 | |

| Packaging Materials | Mass (kg) | Packaging (as % of product mass) | Biogenic material, kg C/declared unit | |
|---------------------|-----------|----------------------------------|--|--|
| Steel | 0.0025 | <0.1% | | |
| Plastic | 0.0017 | <0.1% | 0 | |
| Cardboard | 0.0002 | <0.1% | <0.0001 | |

COLORBOND® steel for fencing – fence panels are compliant with the European REACH regulation9. No products declared within this EPD contain substances exceeding the limits for registration according to the European Chemicals Agency's "Candidate List of Substances of Very High Concern for authorisation". For safe use and maintenance, refer to the product Safety Data Sheet (SDS) at http://www.steel.com.au/library

What is an SDS?

A Safety Data Sheet (SDS) is a document that describes the chemical and physical properties of a product or material and provides safe handling and use information.

Industry Classification

| Product | Classification | Code | Category |
|------------------------|----------------|-------|---|
| COLORBOND® steel for | UN CPC | 41231 | Flat-rolled products of non-alloy steel, clad, plated, coated or otherwise further worked |
| fencing – fence panels | ANZSIC | 2110 | Iron Smelting and Steel Manufacturing |

^{5.} The product composition provided is an average and variability among individual products is expected. Please note that we are constantly working to improve our products and changes to their composition may occur over time. If clarification on a particular product is needed please contact BlueScope Steel Direct on 1800 800 789.

^{6.} As per EPD rules, only 'post-consumer' recycled content figures can be reported. Since BlueScope is only able to provide recycled content figures based on a combination of both pre- and post-consumer materials, this has to be reported as '0%' under EPD rules. For clarity, across the range of steel products manufactured by BlueScope in Australia, the average recycled content in the steel is 17.4%, which includes a combination of pre- and post-consumer recycled materials (according to recycled content categories defined in ISO 14021:2016). Scrap and iron-bearing materials generated and reclaimed from BlueScope's steelmaking, coating and painting operations represent an additional 6.8% recovered content, which is not reported as recycled content. Scrap from rollforming and fabrication processes are included as pre-consumer recycled content. The figures provided are based on FY20 data. For current recycled content figures please contact BlueScope Steel Direct on 1800 800 789.

^{7.} Proprietary coatings (pre-treatment, primer and finish coat).

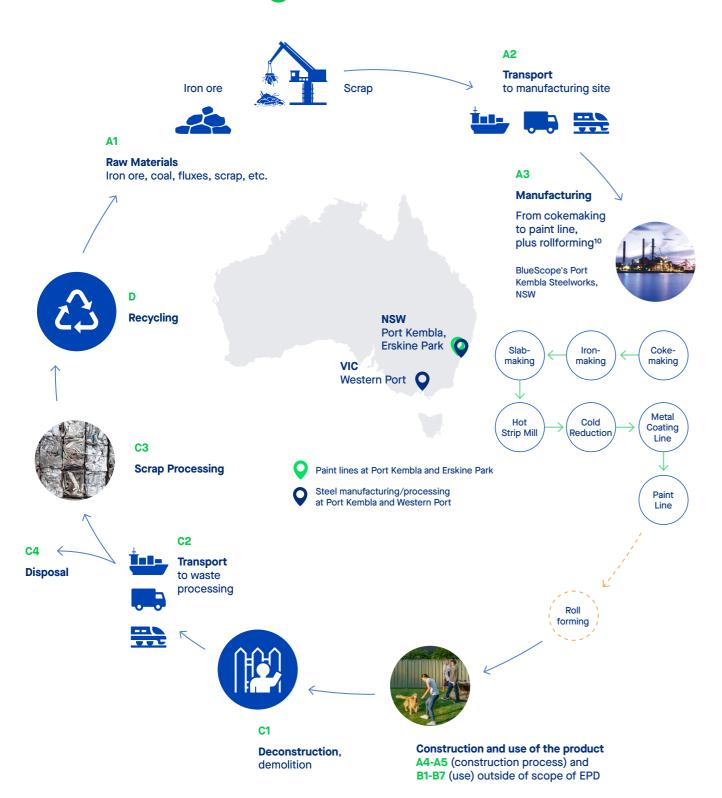

^{8.} Proprietary coatings (pre-treatment, primer and reverse coat)

^{9.} Regulation (EC) No. 1907/2006 of the European Parliament and of the Council of 18 December 2006 on the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH)

^{3.} Refer to the COLORBOND® steel for fencing datasheet at www.steel.com.au

^{4.} The indicative rollforming results provided are an average and variability among different products, operations, companies and sites is expected. Results are based on rollforming data corresponding to a 12 month period, which varied by rollformer (ranging from July 2018 to June 2021). Some of this data has been obtained from third parties. BlueScope does not accept any responsibility for the accuracy, completeness or reliability of data provided by third parties.

COLORBOND® steel for fencing (fence panels) - Manufacturing and Processing in Australia

Scope of Declaration

This declaration is for one flat square metre (1 m²) of COLORBOND® steel for fencing – fence panels, with a substrate metal coating class AM100 in 0.35mm base metal thickness (BMT) manufactured by BlueScope in Australia¹¹. The scope of this declaration is from cradle to gate (modules A1-A3), with modules C1-C4 and module D. It includes an extension of the modules A1-A3 to include rollforming up to the rollformer gate¹².

The use of the results of modules A1-A3 without considering the results of module C is discouraged.

Modules A4-A5 (construction process) and B1-B7 (use) have not been included due to the inability to predict how the material will be used following manufacture.

The system boundary applied in this study extends from mining of raw materials such as iron ore and coal; transport to and within the manufacturing site; coke, sinter, iron and steel manufacture; ancillary service operations; hot rolling of steel products, cold reduction, metallic coating and coil painting and packaging for dispatch to direct customers at the exit gate of the paint line. Removable films that may be applied to COLORBOND® steel for fencing - fence panel product at the paint line for protection during transport and installation are excluded from the scope of this EPD.

The system boundary has been extended to include transport to the rollforming site, rollforming operations and packaging for dispatch to rollformers' customers at the exit gate of the rollforming site, presented as 'A1-A3 incl. rollforming' in the Results section.

The system boundary also includes manufacture of other required input materials, transport between processing operations, the production of external services such as electricity, natural gas and water, and the production of co-product materials within the steelmaking process, which have been removed by the use of allocation techniques. Wastes and emissions to air, land and water are also included, as are modules C1-C4 (end of life stage), and module D (reuse, recovery and/or recycling potential).

| | Pro | duct st | tage | pro | ruction cess age | | Use stage | | | End of life stage | | | Benefits and loads beyond the system boundary | | | | |
|----------------------|---------------------|-----------|---------------|-----------|-----------------------------|-----|-------------|--------|-------------|-------------------|------------------------|-----------------------|--|-----------|------------------|----------|---|
| | Raw material supply | Transport | Manufacturing | Transport | Construction / installation | Use | Maintenance | Repair | Replacement | Refurbishment | Operational energy use | Operational water use | De-construction, demolition | Transport | Waste processing | Disposal | Reuse / recovery / recycling potential |

| Variation - sites | | <10% | | - | - | - | - | - | - | - | - | - | _ | - | - | - | - |

X = Module declared; ND = Not declared (such a declaration shall not be regarded as an indicator of a zero result).

^{11.} As described in the Product Description on page

^{12.} To provide indicative results for the final formed product up to the rollforming gate, data has been obtained from selected sites of several rollformers based in Australia. Results are based on rollforming data corresponding to a 12 month period, which varied by rollformer (ranging from July 2018 to June 2021). The results represent an average of the data collected across the range of steel products formed from the surveyed sites. These results may not be representative of the final formed product from the rollforming operations of other companies or sites. Variability among different products, operations, companies and sites is expected. Actual results will vary depending on a range of factors specific to the particular operations of the downstream processors. Some of this data has been obtained from third parties. BlueScope does not accept any responsibility for the accuracy, completeness or reliability of data provided by third parties.

Life Cycle Assessment (LCA) Methodology

This EPD has been produced in conformance with the requirements of PCR 2019:14 v1.3.4 Construction Products, the Instructions of the Australasian EPD Programme v4.1 and the International EPD® System General Programme Instructions (GPI) v4.0.

Primary data

This study focuses on the further processing of steel beyond hot rolling to produce COLORBOND® steel for fencing - fence panel product. Upstream hot rolled steel manufacturing data for Hot Rolled Coil - low carbon¹³ steel used in this study was obtained from v2.0 of the EPD for Steel – Hot Rolled Coil (S-P-00557).

Primary data were collected for all relevant BlueScope manufacturing sites in Australia, for all inputs and outputs in the production stage (A1-A3). This study is based on an annual average for the time period July 2018 to June 2019. All direct emissions data were procured from the average results reported to the National Pollution Inventory over the 3-year period 2016 to 2019.

To provide indicative results for the final formed product up to the rollforming gate, primary data for rollforming were collected from selected sites of several rollformers based in Australia, including Lysaght (all sites), Metroll (Perth, Albany and Bunbury sites) and Steeline (Hunter sites). The data was collected across a 12 month period ranging from July 2018 to June 2021 for each site.

Secondary data

The secondary data used were procured from the Managed LCA Content (MLC) Database 2022, formerly known as GaBi Life Cycle Inventory Database¹⁴. Most datasets used have a reference year between 2018 and 2021 and all fall within the 10-year limit allowable for generic data under EN 15804. The residual electricity mix on the market is used for the A3 processes that BlueScope has control over. Since a residual grid mix has not been published for Australian states, the residual supply mix (RSM) is modelled using the specific electricity grid mix subtracting renewables from the consumption mix in the market (conservative estimation based on PCR v1.3.4 section 4.8.1). Generation from small solar in the market-based method's residual mix factor (RMF) is calculated as 53% of the small solar generation. This is the estimated share of rooftop small solar generation sent to the grid (self-consumed 'behind the meter' is calculated at the national level and is estimated to be 47%), following the DCCEEW approach (DCCEEW, 2023) based on the peer-reviewed source McKenna et al (2019).

Location-based grid mix EFs (using the published grid mix) is used for other electricity consumption including modules C and D.

Market-based results (using the RSM) are reported as the main results. For comparability with EPDs that were published with older PCRs (i.e. before PCR 1.3.2), which allowed the use of location-based grid mix when RSM wasn't available, the location-based results (using the published grid mix) are published under additional information for the GWP-GHG (IPCC AR5) indicator only. The original Sphera datasets are used to run the results for location-based grid mix before updating the electricity modelling based on RSM.

The composition of the residual electricity grid for New South Wales (NSW) and Victoria (VIC) are modelled in the Life Cycle for Experts (LCA FE) (formerly known as GaBi) Software for life cycle engineering, developed by Sphera Solutions, Inc. based on published data for the financial year 1st July 2021 – 30st June 2022 (Australian Government, 2023). Onsite consumption and grid transmission and distribution losses are calculated based on data from the Australian Government Department of Climate Change, Energy, the Environment and Water (Australian Government, 2023).

The NSW residual electricity mix is made up of coal (81.5%), photovoltaic (5.69%), natural gas (3.47%), heavy fuel oil (0.147%), and coal gases (0.000712%). Of the remaining electricity, 5.83% is imported from Victoria, and 3.32% is imported from Queensland. Onsite consumption (4.97%), and the medium voltage (1kV-60kV) grid's transmission and distribution losses (1.83%) are included. The emission factor for the NSW residual grid mix for the GWP-GHG indicator is 0.99 kg CO₂-eq/kWh based on EF3.0.

The VIC residual electricity mix is made up of lignite (85.1%), photovoltaic (5.41%), and natural gas (3.25%). Of the remaining electricity, 3.02% is imported from Tasmania, 2.22% is imported from Southern Australia, and 0.96% is imported from New South Wales. Onsite consumption (6.98%), and the medium voltage (1kV-60kV) grid's transmission and distribution losses (2.31%) are included. The emission factor for the Victoria residual grid mix for the GWP-GHG indicator is 1.13 kg CO₂-eq/kWh based on FE3.0

For the modelling for rollforming operations, LCA FE statespecific grid mix datasets were used to create a productionweighted average grid mix, based on BlueScope's transport data to rollformers in different States, resulting in an emission factor for the GWP-GHG indicator of 0.942 kg CO₂-eq/kWh. Non-renewable primary energy as material utilisation (PENRM) was calculated for the primer, backer paint, topcoat paints, and resins applied on the paint lines. The calculated PENRM scales automatically with the product flows. PENRM is not calculated for packaging materials since energy input and output occur in the same module (A1-A3). Hence, the energy value for packaging will be balanced out in Module A1-A3. Additionally, the packaging energy is insignificant.

Based on PCRv1.3.4, option C is used to calculate the PENRM indicator to account for the inherent energy of paint materials in the product. Paint materials used as raw materials are declared as energy stored in the product (module A1-A3). At the end-of-life (module C3), the energy stored is released based on the recycling rate of 90%.

Water use in relation to BlueScope's manufacturing sites was modelled using the specific watershed scarcity data for each BlueScope manufacturing site. For the rollforming operations, water use was modelled using the generic Australian water scarcity data for rollforming.

Cut off criteria

All relevant and available data were collected. While cut-off criteria according to the Product Category Rules (PCR) section 4.4 were employed, much of the data which would have fallen within that scope were included where available, resulting in a data set which is robust and captures all significant contributors to the LCA results. Inputs knowingly excluded are the transport and packaging of minor inputs, such as lubricants and greases, which are used in very small quantities.

Personnel is excluded as per section 4.3.2 in the PCR (EPD International, 2024). thinkstep-anz consistently excludes environmental impacts from infrastructure, construction, production equipment, and tools that are not directly consumed in the production process ('capital goods'). This is because high-quality infrastructure-related data isn't always available and there is no clear cut-off for what to include. For this reason, capital goods data may be applied to LCA studies inconsistently and could lead to reduced consistency and comparability of EPDs.

Allocation

For the modelling for BlueScope's manufacturing sites, where subdivision of processes was not possible, allocation was carried out using the most relevant physical quantity, predominantly the mass of throughput (e.g. steel coil) or surface area of the coil (e.g. surface coatings).

Economic allocation was not used in this study. In BlueScope's Hot Rolled Coil (HRC) EPD (used as an input for this study), any open scrap inputs into manufacturing have remained unconnected, and so have been treated as 'burden free' (BlueScope, 2020). This is not consistent with the PCR – however, adjusting BlueScope's Hot Rolled Coil EPD is not possible until such time as better data on the environmental burden of input scrap (i.e., economically allocated pre-consumer scrap) is available. It is planned to review this when the HRC EPD is updated in 2025. In the meantime, the HRC input is left unchanged to maintain consistency with the metallic coated and painted EPDs published in 2023. No use of system expansion was made (excepting Module D).

End of life

The modelling for Module C1 (deconstruction, demolition) was based on the use of a 100 kW construction excavator (fuel consumption of 0.172 kg diesel per tonne steel). The modelling for Module C2 (transport) assumed 50 km transport by truck to a waste processing facility or landfill.

The recycling scenario was based on the National Waste Report 2020¹⁵, which indicates that the average metals recycling rate in Australia is 90%. This is considered to be a conservative estimate for flat steel construction products but was used in the absence of verified higher recycling rates.

End of life allocation follows the requirements of EN 15804:2012+A2:2019 section 6.4.3.3 and generally follows the polluter pays principle. Any open scrap inputs into manufacturing remain unconnected, and so are treated as 'burden free'. At the end of life of a product, scrap is collected for recycling and is thus available to produce a recycling credit within Module D. A credit for net scrap is given in Module D based on the base metal used in the product.

Key assumptions and qualifications:

- Accuracy of data measurement falls within normal industrial weighing systems accuracy limits of +/-5%.
- Transport and packaging of minor materials is insignificant to the overall impacts.
- Nominally identical products are produced on a combination of production lines in parallel, and therefore the impacts of each product are a weighted average of the various production lines. The impact of any differences in the composition of the products, with the exception of any change in base metal thickness (BMT), is insignificant on the outcomes of the LCA.
- Proprietary chemicals and paints can be sufficiently modelled using guidance from Safety Data Sheets and conservative assumptions on that basis.
- Upstream data taken from the Sphera LCA FE database reflects average or generic production and therefore does not correspond to BlueScope's actual suppliers.
- Rollforming data has been obtained from selected sites of several rollformers based in Australia. Some of this data has been obtained from third parties. BlueScope does not accept any responsibility for the accuracy, completeness or reliability of data provided by third parties. The indicative rollforming results represent an average of the data collected for the range of steel products formed from the surveyed sites. The rollforming results may not be representative of the final formed product from any particular rollforming operation, company or site. Variability among different products, operations, companies and sites is expected. Actual results will vary depending on a range of factors specific to the particular operations of the downstream processors.
- The Module D recovery stage assumes that paint coatings are incinerated and metal coatings are lost as slag during the steel recycling process. This is a conservative assumption for metal coatings as they are likely to make up part of future steel alloys.

COLORBOND® steel for fencing - Fence panels: Substrate AM100 coating at 0.35mm BMT

Environmental Performance

The environmental impact indicators included in this EPD are described in the table below. All the result tables from this point will contain the abbreviations only. All results reported in MJ are in net calorific value.

| Indicator | Abbreviation | Units | Characterisation Method |

It shall be noted that the above impact categories represent impact potentials, i.e., they are approximations of environmental impacts that could occur if the emissions would (a) actually follow the underlying impact pathway and (b) meet certain conditions in the receiving environment while doing so. In addition, the inventory only captures that fraction of the total environmental load that corresponds to the functional unit (relative approach).

The estimated impact results are only relative statements, which do not indicate the endpoints of the impact categories, exceeding threshold values, safety margins and/or risks.

^{16.} The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.

^{17.} GWP-GHG (IPCC AR5) is an additional GWP100 indicator that is aligned with the Intergovernmental Panel on Climate Change (IPCC) 2013 Fifth Assessment Report (AR5) (IPCC 2013), national greenhouse gas reporting frameworks in Australia and New Zealand and previous versions of the Construction Products PCR (PCR2019:14v1.11). It excludes biogenic carbon and indirect radiative forcing. Market-based results (using the RSM) are reported as the main results.

^{18.} Similar to the above indicator. For comparability with EPDs that were published with older PCRs (i.e. before PCR 1.3.2), which allowed the use of location-based grid mix when RSM wasn't available, the location-based results (using the published grid mix) are published under additional information for the GWP-GHG (IPCC ARS) indicator only. The original Sphera datasets are used to run the results for location-based grid mix.

^{19.} This indicator is identical to GWP-total except that the CF for biogenic CO2 is set to zero. It has been included in the EPD following the PCR (EPD International, 2024).

^{20.} This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and some construction materials, is also not measured by this indicator.

COLORBOND® steel for fencing - Fence panels: Substrate AM100 coating at 0.35mm BMT

Results for 1 m² of COLORBOND® steel for fencing with AM100 metallic coating in 0.35mm base metal thickness (BMT)

In accordance to EN 15804:2012+A2:2019

Product mass: 2.93 kg/m² flat

Note: Results for 'A1-A3 incl. rollforming' are for one square metre (1 m²) of flat product. The profile of the rollformed product will affect how many flat square metres are required to cover a given surface area.

- 21. The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.
- 22. GWP-GHG (IPCC AR5) is an additional GWP100 indicator that is aligned with the Intergovernmental Panel on Climate Change (IPCC) 2013 Fifth Assessment Report (AR5) (IPCC 2013), national greenhouse gas reporting frameworks in Australia and New Zealand and previous versions of the Construction Products PCR (PCR2019:14v1.11). It excludes biogenic carbon and indirect radiative forcing. Market-based results (using the RSM) are reported as the main results.
- 23. Similar to the above indicator. For comparability with EPDs that were published with older PCRs (i.e. before PCR 1.3.2), which allowed the use of location-based grid mix when RSM wasn't available, the location-based results (using the published grid mix) are published under additional information for the GWP-GHG (IPCC AR5) indicator only. The original Sphera datasets are used to run the results for location-based grid mix.
- 24. This indicator is identical to GWP-total except that the CF for biogenic CO2 is set to zero. It has been included in the EPD following the PCR (EPD International, 2024).
- 25. This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and some construction materials, is also not measured by this indicator.

Interpretation of Results

Impact Category Results

The majority of production (A1-A3) impacts arise from the combustion of fossil fuels, either directly or in the upstream production of electricity and materials. The upstream production of Hot Rolled Coil steel substrate was the most significant contributor to most environmental impact indicators, and the base metal thickness (BMT) has significant influence on the results due to the dominance of the manufacturing of the steel substrate. This emphasises the importance of selecting the appropriate BMT for the intended application; where a thicker steel sheet does not contribute to structural integrity, a lighter-weight version of COLORBOND® steel for fencing - fence panels product with a lower BMT should be considered.

The upstream production of metal coating alloys – a combination of aluminium, zinc and magnesium applied to the steel substrate for corrosion protection – was the most significant contributor to ADP-minerals & metals, IRP, and SQP, and also contributed significantly to most indicators.

Rollforming generally adds less than 5% to total impacts, but has significant impact for EP-freshwater, ODP, WDP, and SQP. These impacts were driven by the upstream production of electricity and cardboard used by rollformers.

Assumption of average product – Sensitivity of results

When similar products are manufactured on different production lines, there is sometimes variation in results. Should production scheduling change significantly, this may be reflected in changes in the calculated impacts. The reason for these differences is the different mix of production routes that contribute to each product. Where products are preferentially made at different locations, the differences are most evident. While unlikely, should production scheduling change significantly, this may be reflected in changes in the calculated impacts. The variation in impact across production lines for COLORBOND® steel for fencing - fence panels product is well under 10%.
